Equational Reasoning and Induction

Assignment Project Exam Help

Equational Reasoning

<https://powcoder.com>

Add WeChat powcoder

Functional Programming

- What is functional programming? Some possible answers:
 - Programming with first-class functions
 - `map (\x -> x + 1) [1,2,3] ~> [2,3,4]`
 - Programming with mathematical functions
 - No side-effects (no global mutable state, no IO)
 - Calling a function with the same arguments, always returns the same output (not true in most languages!)

Reasoning about Purely Functional Programs

- When programs behave as mathematical functions, standard mathematical techniques can be used to reason about such programs.
- Such techniques include:
 - **Equational reasoning**: Interpret programs as equations; substitute equals by equals
 - **Structural induction**: The use of recursion means that reasoning techniques such as induction are useful.

Equational reasoning in mathematics

- Whenever we have a system of mathematical equations, we can use equational reasoning to reason about such equations. For example

$$x = y + z$$

$$y = 3z$$

$$z = 5$$

<https://powcoder.com>

Add WeChat powcoder

- Suppose we want to find the value of x

Equational reasoning in mathematics

- Using annotated steps we proceed as follows

$$x = y + z$$

$$\equiv \{?\}$$

Proving that Option is a Monad

- Using equational reasoning and structural induction we can show that the Option instance

Assignment Project Exam Help

instance Monad Option where

return x

<https://powcoder.com>
= Some x

None >>= f

= None

(Some x) >>= f = f x

Add WeChat powcoder

satisfies the monad laws:

$\text{return } a \gg= k = k \ a$

$m \gg= \text{return} = m$

$m \gg= (\lambda x \rightarrow k \ x \gg= h) = (m \gg= k) \gg= h$

Proving that Option is a Monad

- First law:

$\text{return } a \gg= k \equiv \{?\}$

<https://powcoder.com>

Add WeChat powcoder

Proving that Option is a Monad

- Second law:

$m >>= \text{return } \equiv \{?\}$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Proving that Option is a Monad

- Third law:

$m >>= (\lambda x \rightarrow k x >>= h)$

$\equiv \{\text{case analysis (or induction) on } m\}$

1) Case m of None

$\text{None} >>= (\lambda x \rightarrow k x >>= h)$

$\equiv \{?\}$

Structural Induction

Add WeChat powcoder

Induction in mathematics

Induction decomposes a proof into two parts:

- **Base case(s):** Prove that the property holds for the base cases.

<https://powcoder.com>

- **Inductive step(s):** Prove that the property holds for the recursive cases.

Induction in mathematics

The simplest and most common type of induction is induction on natural numbers.

Assignment Project Exam Help

- Base case: Show that the property holds for $n = 0$.
<https://powcoder.com>
- Inductive step: Assuming that the property holds for n , show that the property holds for $n + 1$.
Add WeChat powcoder

In the inductive step, the assumption is called the **Induction Hypothesis**.

Structural Induction

In functional programming, we can use induction to reason about functions defined over datatypes. For example, given the list datatype:

```
data [a] = [] | a : [a]
```

we obtain the following inductive principle:

- **Base case:** Show that the property holds for $xs = []$.
- **Inductive step:** Assuming that the property holds for xs , show that the property holds for $(x:xs)$.

Structural Induction

- Consider the map function:

$\text{map} :: (a \rightarrow b) \rightarrow [a] \rightarrow [b]$
 $\text{map } f [] = []$
 $\text{map } f (x:xs) = f x : \text{map } f xs$

Assignment Project Exam Help
<https://powcoder.com>
id x = x

- It should be clear that mapping the identity function returns the same list back:

$\text{map id } xs \equiv xs$

Can we prove it?

Equational reasoning in mathematics

map id xs
 $\equiv \{?\}$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Equational reasoning in mathematics

map id xs
 $\equiv \{?\}$

Add WeChat powcoder

Equational reasoning in mathematics

- Consider the map function again:

$\text{map} :: (a \rightarrow b) \rightarrow [a] \rightarrow [b]$
 $\text{map } f [] = []$
 $\text{map } f (x:xs) = f x : \text{map } f xs$

$(f . g) x = f (g x)$

- Do you think the following is true?

$\text{map } f (\text{map } g xs) \equiv \text{map } (f . g) xs$ — map fusion

Can we prove it?

Equational reasoning in mathematics

$\text{map } f (\text{map } g \text{ xs})$
 $\equiv \{?\}$

1) **Assignment Project Exam Help**

<https://powcoder.com>

Add WeChat powcoder

Equational reasoning in mathematics

$\text{map } f (\text{map } g \text{ xs})$

$\equiv \{?\}$

2)

Assignment Project Exam Help

Add WeChat powcoder

Functors

It turns out that the map function, together with the laws:

$\text{map } f (\text{map } g \text{ xs}) \equiv \text{map } (f \circ g) \text{ xs}$ — map fusion
 $\text{map } \text{id } \text{xs} \equiv \text{xs}$ — map identity

<https://powcoder.com>

Can be generalized: Add WeChat powcoder

class Functor f where

fmap :: (a -> b) -> f a -> f b

— Laws

— $\text{fmap } f (\text{fmap } g \text{ fa}) \equiv \text{fmap } (f \circ g) \text{ fa}$

— $\text{fmap } \text{id } \text{fa} \equiv \text{fa}$

List Functor

Given the map function and our two proofs, it is easy to create an instance for Functor:

Assignment Project Exam Help

instance Functor [] where

fmap = map <https://powcoder.com>

Add WeChat powcoder

Other Functors

Functors are quite common, nearly all parametrised types (Example: `[a]`, `Maybe a`, `IO a`, ...) are functors

Assignment Project Exam Help

— `data Maybe a = Nothing | Just a`

<https://powcoder.com>

`instance Functor Maybe where`

`-- fmap :: (a -> b) -> Maybe a -> Maybe b`

`fmap f Nothing = Nothing`

`fmap f (Just x) = Just (f x)`

Add WeChat powcoder

Maybe Functor

fmap id ma
 $\equiv \{?\}$

Exercises:

1) Consider the definitions:

$\text{map} :: (a \rightarrow b) \rightarrow [a] \rightarrow [b]$
 $\text{map } f [] = []$
 $\text{map } f (x:xs) = f x : \text{map } f xs$

$\text{length} :: [a] \rightarrow \text{Int}$
 $\text{length} [] = 0$
 $\text{length} (x:xs) = 1 + \text{length } xs$

Prove that:

$\text{length} (\text{map } f \text{ xs}) \equiv \text{length } xs$

length (map f xs)

≡ {Induction on xs}

1) Base case: xs = []

length (map f [])

≡ {definition of map}

length []

2) Inductive case: xs = (y:ys)

length (map f (y:ys))

≡ {definition of map}

length (f y : map f ys)

≡ {definition of length}

1 + length (map f ys)

≡ {Induction Hypothesis}

1 + length ys

≡ {definition of length}

length (y:ys)

Exercises:

2) Consider the definitions:

$\text{map} :: (a \rightarrow b) \rightarrow [a] \rightarrow [b]$
 $\text{map } f [] = []$
 $\text{map } f (x:xs) = f x : \text{map } f xs$

$(++) :: [a] \rightarrow [a] \rightarrow [a]$
 $[] ++ ys = ys$
 $(x:xs) ++ ys = x : (xs ++ ys)$

Prove that:

$\text{map } f (xs ++ ys) \equiv \text{map } f xs ++ \text{map } f ys$

map f (xs ++ ys)
≡ {Induction on xs}

1) Case xs = []

map f ([] ++ ys)
≡ {definition of ++}

map f ys
≡ {definition of ++}

[] ++ map f ys
≡ {definition of map}

map f [] ++ map f ys

Exercises:

3) Consider the definitions:

```
data Tree a = Leaf | Fork a (Tree a) (Tree a)
```

```
mapT :: (a -> b) -> Tree a -> Tree b
```

```
mapT f Leaf = Leaf
```

```
mapT f (Fork x l r) = Fork (f x) (mapT f l) (mapT f r)
```

```
flatten :: Tree a -> [a]
```

```
flatten Leaf = []
```

```
flatten (Fork x l r) = x : flatten l ++ flatten r
```

Exercises:

3) Prove that:

$\text{mapT id} \equiv \text{id}$

$\text{mapT f (mapT g xs)} \equiv \text{mapT (f . g) xs}$

$\text{flatten} . \text{mapT f} \equiv \text{map f} . \text{flatten}$
