

# PROGRAMMING IN HASKELL

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

## Chapter 11 - The Countdown Problem

# What Is Countdown?

? A popular quiz programme on British television that has been running since 1982.

Assignment Project Exam Help

? Based upon an original French version called "Des Chiffres et Des Lettres".

<https://powcoder.com>  
Add WeChat powcoder

? Includes a numbers game that we shall refer to as the countdown problem.

# Example

Using the numbers

1 3 7 10 25 50

Assignment Project Exam Help

<https://powcoder.com>

and the arithmetic operators

Add WeChat powcoder

+ - \* ÷

construct an expression whose value is 765

# Rules

❓ All the numbers, including intermediate results, must be positive naturals (1,2,3,...).

Assignment Project Exam Help

❓ Each of the <https://powcoder.com> source numbers can be used at most once when constructing the expression.

Add WeChat powcoder

❓ We abstract from other rules that are adopted on television for pragmatic reasons.

For our example, one possible solution is

$$(25-10) * (50+1) = 765$$

Assignment Project Exam Help

Notes:

<https://powcoder.com>

Add WeChat powcoder

? There are 780 solutions for this example.

? Changing the target number to **831** gives an example that has no solutions.

# Evaluating Expressions

Operators:

data Op = Add | Sub | Mul | Div

<https://powcoder.com>

Apply an operator:

Add WeChat powcoder

```
apply      :: Op → Int → Int → Int
apply Add x y = x + y
apply Sub x y = x - y
apply Mul x y = x * y
apply Div x y = x `div` y
```

Decide if the result of applying an operator to two positive natural numbers is another such:

```
valid      :: Op → Int → Int → Bool  
valid Add _ _ = True  
valid Sub x y = x > y  
valid Mul _ _ = True  
valid Div x y = x `mod` y == 0
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Expressions:

```
data Expr = Val Int | App Op Expr Expr
```

Return the overall value of an expression, provided that it is a positive natural number:

```
eval      :: Expr → [Int]
eval (Val n) = [n | n > 0]
eval (App o l r) = [apply o x y | x ← eval l, y ← eval r, valid o x y]
```

Assignment Project Exam Help  
<https://powcoder.com>  
Add WeChat powcoder

Either succeeds and returns a singleton list, or fails and returns the empty list.

# Formalising The Problem

Return a list of all possible ways of choosing zero or more elements from a list:

Assignment Project Exam Help

choices :: [a] -> [[a]] <https://powcoder.com>

Add WeChat powcoder

For example:

```
> choices [1,2]
[[],[1],[2],[1,2],[2,1]]
```

Return a list of all the values in an expression:

```
values      :: Expr → [Int]
values (Val n)    = [n]
values (App _ l r) = values l ++ values r
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Decide if an expression is a solution for a given list of source numbers and a target number:

```
solution      :: Expr → [Int] → Int → Bool
solution e ns n = elem (values e) (choices ns)
                && eval e == [n]
```

# Brute Force Solution

Return a list of all possible ways of splitting a list into two non-empty parts:

Assignment Project Exam Help

```
split :: [a] → [[a],[a]]
```

<https://powcoder.com>

Add WeChat powcoder

For example:

```
> split [1,2,3,4]
```

```
[[1],[2,3,4]],[1,2],[3,4]],[1,2,3],[4]]
```

Return a list of all possible expressions whose values are precisely a given list of numbers:

```
exprs :: [Int] → [Expr]
```

```
exprs [] = []
```

```
exprs [n] = [Val n]
```

```
exprs ns = [e | (ls,rs) ← split ns
```

```
    , l      ← exprs ls
```

```
    , r      ← exprs rs
```

```
    , e      ← combine l r]
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The key function in this lecture.

Combine two expressions using each operator:

```
combine  :: Expr → Expr → [Expr]
combine l r =
  [App o l r | o ← [Add,Sub,Mul,Div]]
```

Assignment Project Exam Help

<https://powcoder.com>

Return a list of all possible expressions that solve an instance of the countdown problem.

```
solutions  :: [Int] → Int → [Expr]
solutions ns n = [e | ns' ← choices ns
                      , e  ← exprs ns'
                      , eval e == [n]]
```

# How Fast Is It?

System: 2.8GHz Core 2 Duo, 4GB RAM

Compiler: **Assignment Project Exam Help**  
GHC version 7.10.2  
<https://powcoder.com>

Example: `solutions [1,3,7,10,25,50] 765`  
**Add WeChat powcoder**

One solution: 0.108 seconds

All solutions: 12.224 seconds

# Can We Do Better?

? Many of the expressions that are considered will typically be invalid - fail to evaluate.

Assignment Project Exam Help

? For our example, only around 5 million of the 33 million possible expressions are valid.

<https://powcoder.com>

Add WeChat powcoder

? Combining generation with evaluation would allow earlier rejection of invalid expressions.

# Fusing Two Functions

Valid expressions and their values:

Assignment Project Exam Help  
`type Result = (Expr,Int)`

<https://powcoder.com>

We seek to define a function that fuses together the generation and evaluation of expressions:

```
results  :: [Int] → [Result]
results ns = [(e,n) | e ← exprs ns
                    , n ← eval e]
```

This behaviour is achieved by defining

```
results [] = []  
results [n] = [(Val n,n) | n > 0]  
results ns =  
  [res | (ls,rs) ← split ns  
    , lx      ← results ls  
    , ry      ← results rs  
    , res     ← combine' lx ry]
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

where

```
combine' :: Result → Result → [Result]
```

## Combining results:

```
combine' (l,x) (r,y) =  
  [(App o l r, apply o x y)  
   | o ← [Add,Sub,Mul,Div]  
   , valid o x y]
```

Assignment Project Exam Help

<https://powcoder.com>

New function that solves countdown problems:

Add WeChat powcoder

```
solutions' :: [Int] → Int → [Expr]  
solutions' ns n =  
  [e | ns' ← choices ns  
    , (e,m) ← results ns'  
    , m == n]
```

# How Fast Is It Now?

Example:

```
solutions' [1,3,7,10,25,50] 765
```

Assignment Project Exam Help

<https://powcoder.com>

One solution: 0.014 seconds

Add WeChat powcoder

Around 10  
times faster in  
both cases.

All solutions: 1.312 seconds

# Can We Do Better?

? Many expressions will be essentially the same using simple arithmetic properties, such as:

Assignment Project Exam Help

$$x * y = y * x$$

<https://powcoder.com>  
Add WeChat powcoder

$$x * 1 = x$$

? Exploiting such properties would considerably reduce the search and solution spaces.

# Exploiting Properties

Strengthening the valid predicate to take account of commutativity and identity properties:

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
valid      :: Op → Int → Int → Bool
```

```
valid Add x y = True
```

$x \leq y$

```
valid Sub x y = x > y
```

```
valid Mul x y = True
```

$x \leq y \ \&\& \ x \neq 1 \ \&\& \ y \neq 1$

```
valid Div x y = x `mod` y == 0
```

$\&\& \ y \neq 1$

# How Fast Is It Now?

Example:

solutions" [1,3,7,10,25,50] 765

Assignment Project Exam Help

<https://powcoder.com>

Valid:

250,000 expressions

Add WeChat powcoder

Around 20  
times less.

Solutions: 49 expressions

Around 16  
times less.

One solution: 0.007 seconds

Around 2  
times faster.

Assignment Project Exam Help

All solutions: 0.119 seconds  
<https://powcoder.com>

Around 11  
times faster.

Add WeChat powcoder

More generally, our program usually returns all solutions in a fraction of a second, and is around 100 times faster than the original version.
