## PROGRAMMING IN HASKELL

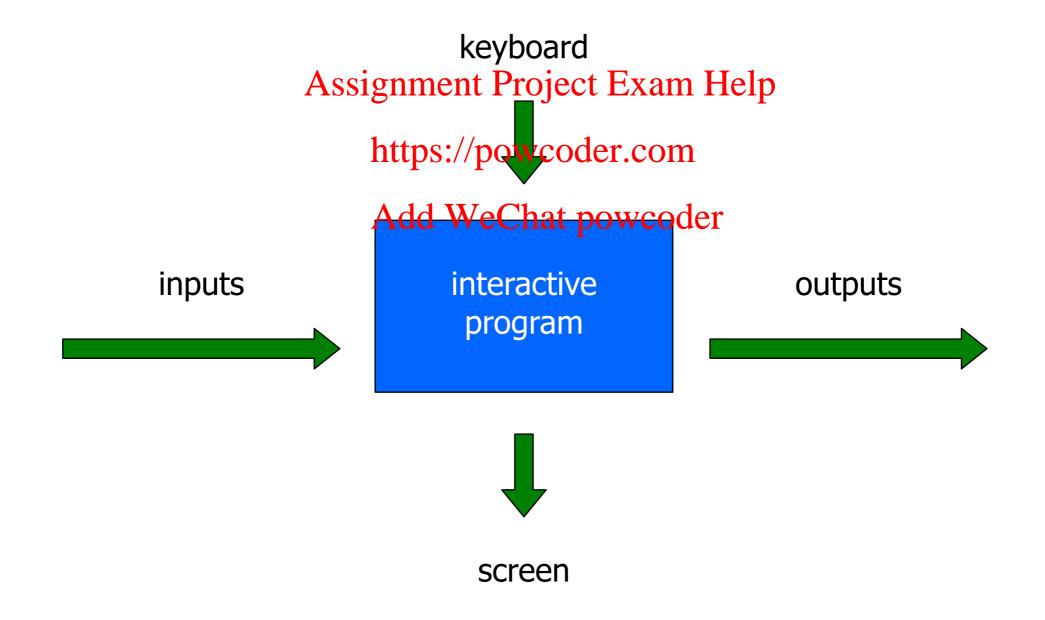

Chapter 9 - Interactive Programs

## Introduction

To date, we have seen how Haskell can be used to write <u>batch</u> programs that take all their inputs at the start and give all their outputs at the end.

However, we would also like to use Haskell to write <u>interactive</u> programs that read from the keyboard and write to the screen, as they are running.

## **The Problem**

Haskell programs are pure mathematical functions:

Project Exam Help Haskell programs have no side effects.

https://powcoder.com

Add WeChat powcoder

However, reading from the keyboard and writing to the screen are side effects:

? Interactive programs have side effects.

## **The Solution**

Interactive programs can be written in Haskell by using types to distinguish pure expressions from impure <u>actions</u> that may involve side effects.

Assignment Project Exam Help

https://powcoder.com

Add WeChat powcoder

The type of actions that return a value of type a.

#### For example:

The type of actions that return a character.

### Assignment Project Exam Help

https://powcoder.com

Add WeChatTpexypedof purely side effecting actions that return no result value.

#### Note:

() is the type of tuples with no components.

## **Basic Actions**

The standard library provides a number of actions, including the following three primitives:

### Assignment Project Exam Help

The action getChar reads a character from the keyboard, echoes it to the screen, and returns the character as its result value:

getChar :: IO Char

The action <u>putChar c</u> writes the character c to the screen, and returns no result value:

putChar :: Char → IO ()

Assignment Project Exam Help

https://powcoder.com

The action <u>return v</u> simply return white wature would perform in any interaction:

return :: a → IO a

# Sequencing

A sequence of actions can be combined as a single composite action using the keyword <u>do</u>.

For example:

Assignment Project Exam Help

https://powcoder.com

Add WeChat powcoder

act :: IO (Char, Char)

act = do x ← getChar

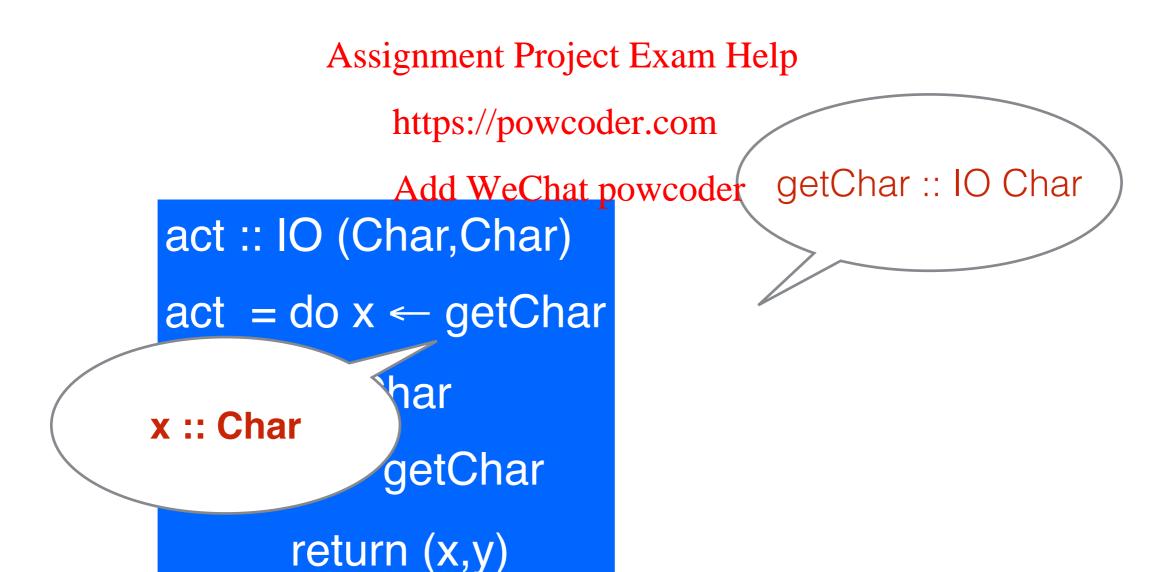

getChar

y ← getChar

return (x,y)

## do-notation again

IO also supports the do-notation and again, similarly to what happened with Parsers, we need to be careful understanding the typing of the  $\leftarrow$ 

### **Derived Primitives**

Reading a string from the keyboard:

```
Assignment Project Exam Help
getLine :: IO String
https://powcoder.com
getLine = do x ← getChar
Add WeChat powcoder
if x == '\n' then
return []
else
do xs ← getLine
return (x:xs)
```

Writing a string to the screen:

```
putStr :: String → IO ()

putStr [] = ?

putStr (x: Assignment Project Exam Help

https://powcoder.com
```

Add WeChat powcoder

Writing a string and moving to a new line:

putStrLn :: String → IO ()
putStrLn xs = do putStr xs
 putChar '\n'

## **Example**

We can now define an action that prompts for a string to be entered and displays its length:

### Assignment Project Exam Help

```
strlen :: IO ()

Add WeChat powcoder
strlen = do putStr "Enter a string: "

xs ← getLine

putStr "The string has "

putStr (show (length xs))

putStrLn " characters"
```

For example:

> strlen

Enter a string: abcde.
Assignment Project Exam Help
The string has 5 characters
https://powcoder.com

Add WeChat powcoder

Note:

Evaluating an action <u>executes</u> its side effects, with the final result value being discarded.

# Hangman

Consider the following version of <u>hangman</u>:

- One player secretly types in a word.

  Assignment Project Exam Help
- The other player tries to dettpse/theworderbycentering a sequence of guesses.

Add WeChat powcoder
For each guess, the computer indicates which letters in the secret word occur in the guess.

The game ends when the guess is correct.

We adopt a <u>top down</u> approach to implementing hangman in Haskell, starting as follows:

### Assignment Project Exam Help

```
https://powcoder.com
hangman :: IO Add WeChat powcoder
hangman =
do putStrLn "Think of a word: "
word ← sgetLine
putStrLn "Try to guess it:"
play word
```

The action <u>getCh</u> reads a single character from the keyboard, without echoing it to the screen:

```
import System.IO

Assignment Project Exam Help

getCh :: IO Chaps://powcoder.com

getCh = do hSetEcho stoin Faise

x ← getChar

hSetEcho stdin True
```

return x

The action <u>sgetLine</u> reads a line of text from the keyboard, echoing each character as a dash:

Assignment Project Exam Help

https://powcoder.com

sgetLine :: IO Stridg eChat powcoder

sgetLine =?

The function <u>match</u> indicates which characters in one string occur in a second string:

```
match :: String → String → String

Assignment Project Exam Help

https://powcoder.com
```

Add WeChat powcoder

For example:

> match "haskell" "pascal"
"-as--II"

The function <u>play</u> is the main loop, which requests and processes guesses until the game ends.

### Assignment Project Exam Help

```
play :: String \( \frac{\text{https://powcoder.com}}{\text{Add WeC}} \)
play word = ?
```

## **Exercise**

Implement the game of <u>nim</u> in Haskell, where the rules of the game are as follows:

### Assignment Project Exam Help

The board comprises five towns of starscoder.com

Add WeChat powcoder

- Two players take it turn about to remove one or more stars from the end of a single row.
- The winner is the player who removes the last star or stars from the board.

Assignment Project Exam Help

https://powcoder.com

Add WeChat powcoder

#### Hint:

Represent the board as a list of five integers that give the number of stars remaining on each row. For example, the initial board is [5,4,3,2,1].
